## About myself: @sasha\_cohn

- Software Craftsman with C++ as mother tongue
- Part of the **Core C++** community since the early days
- Enhancing core performance at **Priority Software** and migrating C++ of 1980s to the cloud

# Agenda

- Fundamentals of `const`
- Making `const` More Flexible
- `const` in API Design & Member Functions
- Shallow vs. Deep `const`
- Best Practices
- Questions

# 1. What is **const** in C ? values and pointers

```
int i = 42;  
i = 12;  
const int ci = 42;  
ci = 12;  
int *pi = &i;  
*pi = 42;  
int *pp = &ci;  
const int *pci = &ci;  
int k = *pci;  
*pci = 12;
```

# 1. Top-level vs low-level `const`

Variable: cannot change after initialization

```
char *const pc = s[0];
```

Variable type: cannot touch the memory it points to

```
const char *cp = s[0];
```

Both:

```
const char *const cpc = s[0];
```

# 1. Top-level vs low-level `const`

```
int a[] {4,2,3};  
const int *p1 = a;  
p1++;  
*p1 = 5;  
int const *p2 = a;  
p2++;  
*p2 = 5;
```

```
int *const p3 = a;  
p3++;  
*p3 = 5;  
int const *const p4 = a;  
p4++;  
*p4 = 5;
```

```
a++; // behaves similar to p3  
*a = 5;
```

<https://godbolt.org/z/3qxqx8zd6>

# 1. What is **const** in C++? object

```
struct S {  
    int i = 12;  
};
```

```
const S s;  
s.i = 10;
```

<https://godbolt.org/z/Eer88oWa3>

# 1. What is **const** in C++? member var

```
struct S {  
    const int i = 12;  
} s;
```

```
s.i = 10;
```

<https://godbolt.org/z/br39axd3f>

# 1. What is **const** in C++? initialize

```
struct S {  
    const int i = 12; // similar to readonly in C#  
};
```

```
S s {.i = 10}; // OK
```

# 1. What is **const** in C++? initialize

```
struct S {  
    int i = 12;  
};
```

```
const S s {.i = 10}; // OK
```

<https://godbolt.org/z/9T9K9Mf96>

# 1. What is **const** in C++? method

```
struct S {  
    int i = 12;  
    int get() { return i; } // must be explicit  
};
```

```
const S s;  
s.get();
```

<https://godbolt.org/z/zc646185z>

# 1. What is **const** in C++? method

```
struct S {  
    int i = 12;  
    int get() const { return i; }  
};
```

```
const S s;  
s.get(); // OK
```

<https://godbolt.org/z/33z3jreeq>

# 1. What is **const** in C++? parameters

```
int foo_bad(const int n) {  
    return n++;  
}
```

```
int foo_good(const int n) {  
    return n+1;  
}
```

<https://godbolt.org/z/bacz7ajGK>

## 2. What is `const_cast` ?

```
int i = 42;  
const int *cp = &i;  
  
*cp = 10;  
  
int *p = const_cast<int *>(cp);  
int *bad_p = (int *)cp; // -Wold-style-cast  
  
*p = 10;
```

## 2. Be careful with **const\_cast**

```
int i = 42;  
  
const int *cp = &i;  
  
int *p = const_cast<int *>(cp); // OK  
  
*p = 10;  
  
cout << i << endl; // Output: 10
```

<https://godbolt.org/z/EW1zbKaca>

## 2. Be careful with `const_cast`

```
const int i = 42;  
const int *cp = &i;  
int *p = const_cast<int *>(cp); // UB  
*p = 10;  
cout << i << endl; // Output: 42
```

<https://godbolt.org/z/65Yr9vfWK>

## 2. Be careful with `const_cast`

`const_cast` makes it possible to form a reference or pointer to non-`const` type that is actually referring to a [const object](#) or a reference or pointer to non-volatile type that is actually referring to a [volatile object](#). Modifying a **`const`** object through a non-**`const`** access path and referring to a volatile object through a non-volatile [glvalue](#) results in **undefined behavior**.

[const\\_cast conversion - cppreference.com](http://cppreference.com)

## 2. **mutable** member

```
struct S {  
    mutable mutex m;  
    int i;  
    int get() const {  
        lock_guard g(m);  
        return i;  
    }  
}; // https://godbolt.org/z/T1Movhhe5
```

```
const S s { .i = 4; }  
cout << s.get() << endl;
```

### 3. **const** method: promise to the caller

```
struct S {  
    int i = 1;  
    int get() { return ++i; }  
    int get() const { return ++i; }  
};
```

<https://godbolt.org/z/hjT7brMG4>

### 3. **const** polymorphism

```
struct S {  
    int i = 12;  
    int get() const { return i; }  
    int get() { return ++i; }  
};  
S s;  
const S &sr = s;  
s.get(); s.get(); s.get(); // ⇒ 13; 14; 15  
sr.get(); // ⇒ 15
```

<https://godbolt.org/z/fhG17TEc3>

### 3. polymorphism: no overload on value

```
struct S {  
    int get(int k) { return k; }  
    int get(const int k) { return k; }  
};
```

<https://godbolt.org/z/ax99zMKKE>

### 3. polymorphism: overload on reference

```
struct S {  
    int get(int &k) { return k; }  
    double get(const int &k) { return 1.0*k; }  
};  
S s;  
int k = 2;  
s.get(k);  
const int n = 1;  
s.get(n); https://godbolt.org/z/KfrM9911M
```

### 3. **const** char\* in execv()

```
int execv(const char *path, char *const argv[]);
```

Can I pass an array of const char pointers as the second argument?

[stackoverflow.com: can-i-pass-a-const-char-array-to-execv](https://stackoverflow.com/questions/1040200/can-i-pass-a-const-char-array-to-execv)

Yes, you can! But not for win32 [CreateProcess\(\)](#).

### 3. surprise of std::map and std::string

```
const map<int, int> m {{1,3},{2,1},{5,4}};  
cout << m[2] << endl; ❌ doesn't compile  
cout << m.at(3) << endl; ✅ throws
```

But

```
const string s {"abcd"};  
cout << s[4] << endl; ❌ works  
cout << s.at(4) << endl; ✅ throws
```

<https://godbolt.org/z/c5TEGdqY3>

## 3. std:: iterators and containers

`vector::begin()` *may be mutable*

`vector::cbegin()` **const**

`vector::operator[]()` *may be mutable*

`string::c_str()` **const**

`string::data()` *may be mutable*

`string_view::data()` **const**

### 3. copy optimization: const ref parameter

Pass by value (copy is created)

```
void byValue(std::string str) {  
    cout << "By value: " << str << endl;  
}
```

Pass by const reference (no copy)

```
void byConstReference(const std::string& str) {  
    cout << "By const reference: " << str << endl;  
}
```

<https://godbolt.org/z/PnP5feYa8>

## 4. Composition challenge

```
struct Object {      int val = 0;    };  
struct Container {  
    Container() : m_Object(new Object()) { }  
    void set(int i) const { m_Object->val = i; }  
    int get() const { return m_Object->val; }  
private:  
    Object *m_Object;  
}; // https://godbolt.org/z/ojPj9qzfd or https://godbolt.org/z/MMcYeGbb1
```

## 4. Composition challenge

```
struct Object {      int val = 0;    };  
struct Container {  
    Container() : m_Object(new Object()) { }  
    void set(int i) const { m_Object->val = i; }  
    int get() const { return m_Object->val; }  
private:  
    const Object *m_Object;  
}; // https://godbolt.org/z/ojPj9qzfd or https://godbolt.org/z/MMcYeGbb1
```

## 4. Composition challenge, solution

The answer: const propagation

[std::experimental::propagate\\_const - cppreference.com](http://std::experimental::propagate_const - cppreference.com)

Not available on MSVC yet.

```
std::experimental::propagate_const<Object *> m_Object;
```

<https://godbolt.org/z/49KzeY64b>

## 4. Composition challenge, how ->()

Minimal demo implementation:

```
template <class T> struct propagate_const {  
    T* operator->() { return m_ptr; }  
    const T* operator->() const { return m_ptr; }  
private:  
    T *m_ptr;  
};
```

<https://godbolt.org/z/7jqgEaThr>

## 5. Summary

- Don't use C-cast, especially not instead of **const\_cast**
- Don't use **const\_cast** when it's undefined behavior
- Use **const** reference in your API to avoid copy
- Mark relevant methods **const**
- Use **mutable** for class members that are not exposed
- Remember the pitfalls of containers

## 5. What we *did not* talk about?

- Loop as `for(const auto &[_ , value]: some_map)`
- C and C++ have immutable `enum` and `#define`
- `constexpr` functions
- `constexpr` VS `consteval`
- Other languages have `final` or `let` or `readonly`
- Other languages have `const` for compile-time constants
- Rust with `mut`
